## Sales Comparison Approach / Comparable method

A set of procedures in which a value indication is derived by comparing the property being appraised to similar properties that have been sold recently, applying appropriate units of comparison, and making adjustments to the sale prices of the comparables based on the elements of comparison. The sales comparison approach may be used to value improved properties, vacant land, or land being considered as thought vacant; it is the most common and preferred method of land valuation when comparable sales data are available.

The Dictionary of Real Estate Appraisal, Third Edition, Appraisal Institute

・ロット (雪) (日) (日)

The method The algebra of AGM Valuation of adjustment factor

- Market research to collect information on recent transactions
- Select relevant "comparables" and develop a comparative analysis
- Compare the subject property with comparable sales
- Estimate adjustment factors
- Adjust the sale price of each comparable
- Reconcile the adjusted price in a single value or a range of values

The method **The algebra of AGM** Valuation of adjustment factor

## Algebra in AGM

Paolo Damian, Salvatore Greco, Paolo Rosato Adjustment Factor Valuation with a Multiple Criteria Analysis M

イロト 不得 とくほ とくほ とう

The method The algebra of AGM Valuation of adjustment factor

## How to find adjustment factors?

- Direct valuation based on previous knowledge
- Cost
- Matched Paired Analysis
- Algebraic solution
- Total Grid
- Replication Method
- MLR

UTA definition The proposal Confidence intervals valuation Innovative aspects

## UTilité Additive

UTA method is a procedure able to asses a set of utility functions, consistent with the decision-maker's a priori preferences.

The set of utility functions is assessed using an ordinal regression method and linear programming.

Linear programming is used to optimally adjust additive non-linear utility functions.

UTA definition The proposal Confidence intervals valuation Innovative aspects

UTA definition The proposal Confidence intervals valuation Innovative aspects

## Objective functions and constraints

Objective function:

 $Min 
ightarrow \varepsilon$ 

Subject to the following constraints:

 $|p_1 - U(a_1)| \le |\varepsilon|$  $\vdots$  $|p_m - U(a_m)| \le |\varepsilon|$ 

イロト イポト イヨト イヨト

Value function

UTA definition The proposal Confidence intervals valuation Innovative aspects

Value can be express using a piecewise additive value function:

$$U(a_j) = \sum_{i=1}^n u_i(g(a_j))g(a_j)$$

UTA definition The proposal Confidence intervals valuation Innovative aspects

## Additional constraints

• Sign:

$$u_i\left(x_i^t\right) \ge 0 \text{ or } u_i\left(x_i^t\right) \le 0$$

Monotonous increasing or decreasing:

$$u_i\left(x_i^{t+1}
ight)\geq u_i\left(x_i^{t}
ight)$$
 or  $u_i\left(x_i^{t}
ight)\geq u_i\left(x_i^{t+1}
ight)$ 

• Declining marginal utility:

$$\frac{u_{i}\left(x_{i}^{t+2}\right) - u_{i}\left(x_{i}^{t+1}\right)}{x_{i}^{t+2} - x_{i}^{t+1}} \leq \frac{u_{i}\left(x_{i}^{t+1}\right) - u\left(x_{i}^{t}\right)}{x_{i}^{t+1} - x_{i}^{t}}$$

Confidence interval valuation and value function space

Objective function for confidence interval valuation:

 $Min \rightarrow U_i \text{ or } Max \rightarrow U_i$ 

Objective function for value function space valuation:

 $Min \rightarrow u_i^t Max \rightarrow u_i^t$ 

Additional constraint:

$$\varepsilon \leq \bar{\varepsilon}$$

UTA definition The proposal **Confidence intervals valuation** Innovative aspects
